roto Shredder Oil

Before the shredders leave the factory the cutting systems are oiled with a mineral oil to protect them against corrosion.

For ongoing good performance cross cut shredding cylinders have to be oiled in order to assure ongoing high performance levels. In this case mineral oils are not allowed to be used for environmental protection reasons. You have to use biodegradable oils. These oils should not be subject to resinification.

roto Shredder oils have been specially developed for shredding systems and we suggest to only use these oils.

Strip cut shredders do not require continuous oiling but if you have oil at hand, oiling these shredders from time to time will help to assure long-term high performance.
